

# INTERACTIVE SOLAR SYSTEM

Our solar system is made up of 1 Star, 8 Planets, 146 Moons, numerous comets, asteroids, space rocks, ice, and several dwarf planets (Pluto).

# EARTH

GALAXY	DIAMETER	DAY LENGTH	AVG TEMPERATURE
Milky Way	12,742 km	24 hours	-89.2°C to 56.7°C

Earth is the only known planet with a diverse range of life forms, making it unique in our solar system

A large portion of Earth appears blue from space due to its abundant water.

Earth's atmosphere contains the right mix of gases, including oxygen, crucial for supporting life.

Earth boasts varied landscapes, from mountains to deserts, supporting a wide array of ecosystems.

Earth's tilt and rotation around the Sun create seasons, shaping its climate and weather patterns.

Earth is the home planet of humanity, providing resources and a habitable environment for our species.
